

Adding an existing project to GitHub using the command line

[Article version: GitHub.com](#) ▾

Mac

Windows

Linux

All

Putting your existing work on GitHub can let you share and collaborate in lots of great ways.

If you are migrating your project from CodePlex, read the [migration guide](#) for more information.

Tip: If you're most comfortable with a point-and-click user interface, try adding your project with GitHub Desktop. For more information, see "[Adding a repository from your local computer to GitHub Desktop](#)" in the *GitHub Desktop Help*.

Warning: Never `git add`, `commit`, or `push` sensitive information to a remote repository. Sensitive information can include, but is not limited to:

- Passwords
- SSH keys
- [AWS access keys](#)
- API keys
- Credit card numbers
- PIN numbers

For more information, see "[Removing sensitive data from a repository](#)."

- 1 [Create a new repository](#) on GitHub. To avoid errors, do not initialize the new repository with `README`, license, or `gitignore` files. You can add these files after your project has been pushed to GitHub.

- 2 Open Git Bash.
- 3 Change the current working directory to your local project.
- 4 Initialize the local directory as a Git repository.

```
$ git init
```

- 5 Add the files in your new local repository. This stages them for the first commit.

```
$ git add .  
# Adds the files in the local repository and stages them for commit. To unstage
```

- 6 Commit the files that you've staged in your local repository.

```
$ git commit -m "First commit"  
# Commits the tracked changes and prepares them to be pushed to a remote repository
```

- 7 At the top of your GitHub repository's Quick Setup page, click  to copy the remote repository URL.

Quick setup — if you've done this kind of thing before

 or [HTTPS](#) [SSH](#) <https://github.com/octocat/hello-world.git> 

We recommend every repository include a [README](#), [LICENSE](#), and [.gitignore](#).

- 8 In the Command prompt, [add the URL for the remote repository](#) where your local repository will be pushed.

```
$ git remote add origin remote repository URL
# Sets the new remote
$ git remote -v
# Verifies the new remote URL
```

- 9 [Push the changes](#) in your local repository to GitHub.

```
$ git push origin master
# Pushes the changes in your local repository up to the remote repository you
```
